

Project File Locations

These locations are all watch folders within the SDN-Cockpit application, as such changes will update the view. It would be best practice to adhere to the SDN-Cockpit installation and set-up guide provided to effectively utilise the firewall application. These are the file locations to run the firewall application.

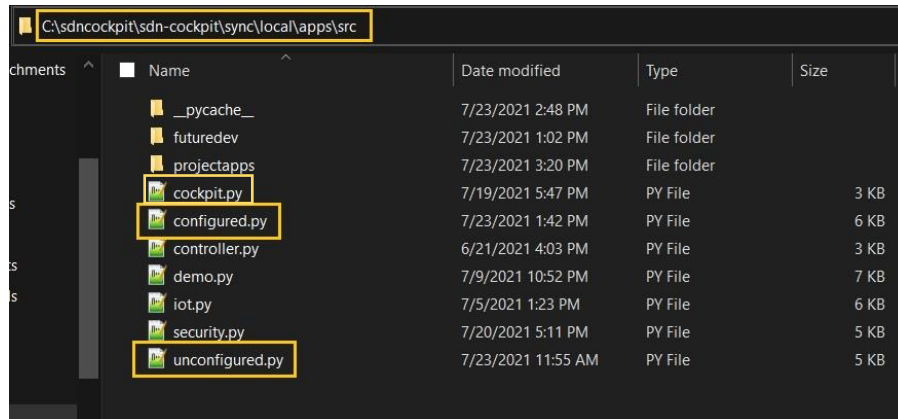

Figure 1. Depicts file location the firewall applications `configured.py` and `unconfigured.py` from the GitHub should be placed if the SDN-cockpit installation was followed, both applications require `cockpit.py`.

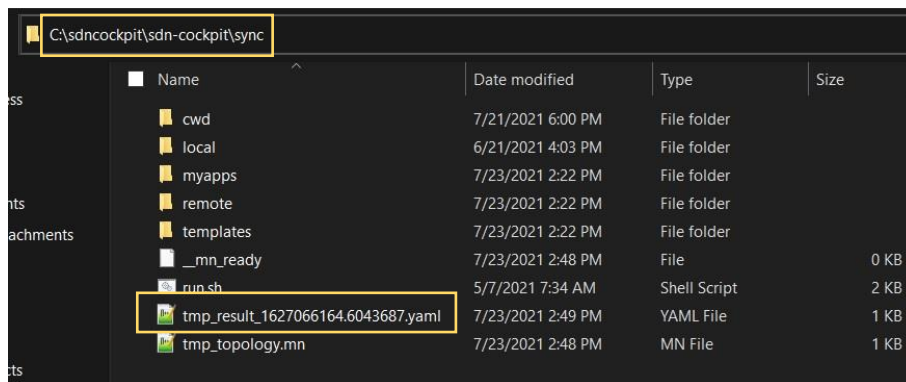

Figure 2. The task `firewall.yaml` file sometimes errors in `SDNCockpit`, check this file name and if necessary in the additional information pane replace with this file name.

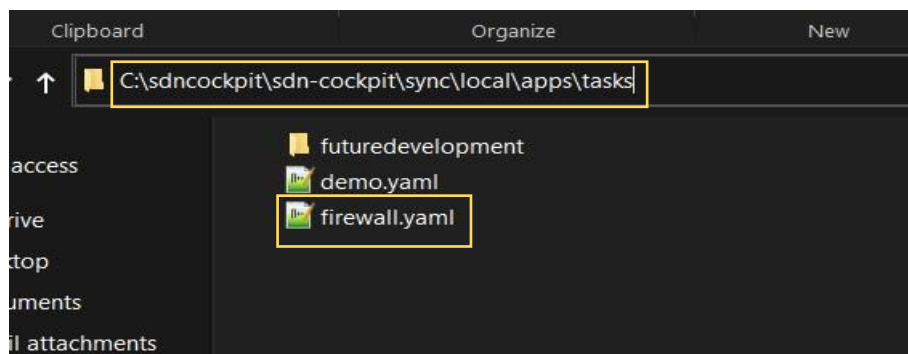

Figure 3. Copy the `firewall.yaml` file from the Task folder of the GitHub to this folder.

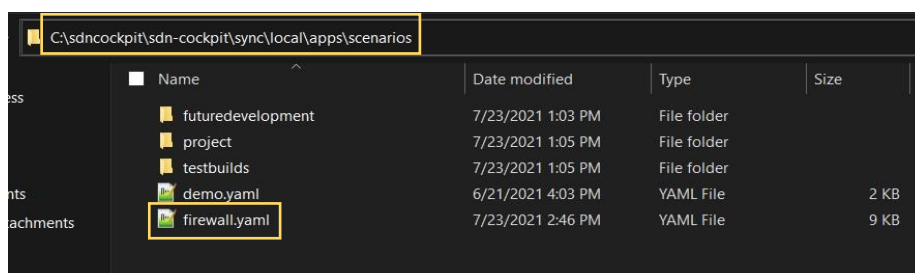

Figure 4. The `firewall.yaml` file stored in the Scenario folder of the repository should be placed in the scenarios folder of SDN-Cockpit.
